Research Note Vol.2

# How Much Can an AI Data Centre Borrow?

A lender's view of a 40 MW Korean and a 100 MW U.S. project

**Shinjae Kang**

2026.10

© 2026 Shinjae Kang

# Debt capacity: 65% of cost in Korea, 63% in the U.S. — in Korea, one power-cost clause splits equity IRR: 16.1% (passed through) vs 5.7% (gross rent)

## One PF engine (sculpting, waterfall, DSRA, LLCR, IRR) run on a 40 MW Korean (KRW) and a 100 MW U.S. (USD) case

### Key metrics [*1,*2,*3,*4,*5,*6]

| Key metric | Value | p. |
|---|---|---|
| Seoul-metro grid approval (2024.8~2026.3) | **1.9% count / 3.0% MW** | 1 |
| Seoul-metro pre-leasing (2027–28 deliveries) | 16–23.5% | 1 |
| Demand growth IEA 2024→2035 (low · base · high) | 4.9% · 10.1% · 13.7% | 2 |
| KTB 3y · 10y (2026-10-20) | 3.84% · 4.18% | 2 |
| UST 10y (2026-10-16) | **5.09%** | 2 |
| Peer-implied equipment price rise (low · mid · high) | 3.3% · 10.9% · 23.9% | 2 |
| Korea 40 MW debt (share of cost) | **KRW 205bn (65%)** | 3 |
| Korea 40 MW min DSCR · equity IRR (ex-TV) | 1.63x · 16.1% (14.0%) | 3 |
| U.S. 100 MW debt (share of cost) | **USD 1,232mn (63%)** | 6 |
| U.S. 100 MW min DSCR · equity IRR (ex-TV) | 1.30x · 13.6% (10.3%) | 6 |
| Korea equity IRR: power passed through vs gross rent | **16.1% vs 5.7%** | 7 |
| Yield on cost (Korea · U.S.) | 14.5% · 9.7% | 7 |
| Phase 2 (20 MW) option value | KRW 33.3bn | 5 |

Source: *1 Blockmedia, readiness and breakeven conditions of four Korean AI data-centre projects (Seoul-metro phase-1 grid applications and final supply approvals, Aug 2024–Mar 2026) *2 Blockmedia (citing CBRE); CBRE Global Data Center Trends 2026; CBRE North America Data Center Trends H1 2026 *3 IEA, Energy and AI (Apr 2025), executive summary *4 Bank of Korea ECOS market rates (daily), USD/KRW *5 FRED, Federal Reserve Bank of St. Louis (DGS10) *6 FSS DART annual reports (consolidated)
Note: KSJ Research. Hypothetical cases; definitions and sources in footnotes and A2–A3. Judgements are the author's own

**KRW 205bn**

Phase 1 (20 MW) debt (65% of cost)

### Korea 40 MW — passed-through power: debt KRW 205bn, equity IRR 16.1%; gross rent: KRW 101bn, 5.7%

- One power-cost clause splits equity IRR: 16.1% (passed through) vs 5.7% (gross rent) — base is pass-through (wholesale practice; Data Center Scouts, gr1d). CBRE's definition of whether rent includes power is not verified; in wholesale leasing, power is usually billed separately
- Maximum gearing sets the limit: min DSCR 1.63x, equity IRR 16.1% (ex-TV 14.0%)
- Pre-leasing 16–23.5% for 2027–28 deliveries; rent about KRW 250,000/kW-month

**$1,232mn**

Debt capacity (KRW 1,641bn; 63% of cost)

### U.S. 100 MW — min DSCR 1.30x; 0.98x if hyperscale rents sit 20% below CBRE quotes

- CBRE's USD 190/kW-month quote is for 250–500 kW; 20% lower on a 100 MW lease gives min DSCR 0.98x at fixed debt (below 1.0x)
- Equity IRR 13.6% (ex-TV 10.3%)
- Margin not yet sourced → 250bp scenario shown · margin 150~350bp: USD 1,296mn~USD 1,172mn

**+10.9%**

Three peers' combined implied price rise (FY2022A→FY2025A)

### Cost risk — peer margins 5.2%→14.4%, evidence of pricing power

- If all margin gain were price: implied rise 3.3%–23.9% (upper bound, not causal)
- CAPEX KRW 14.5bn/MW (Gunsan deal) → 12.0bn (mid): min DSCR 1.63x → 1.79x; equity IRR 16.1% → 18.7%

# Contents

**Structure → data → sizing → stress → option → comparison → yield → implications: each section's conclusion**

I **Structure** 1
Structure: committed leases with power billed separately; Korea adds a 3-yr ramp-up interest reserve — 20 MW + 20 MW option vs U.S. 100 MW

II **Data links** 2
Vol.1 data into PF inputs: base demand growth 10.1%, UST 10y 1.25pp above KTB 3y, peer margins point to pricing power

III **Debt sizing** 3
Korea 40 MW debt capacity KRW 205bn (65% of cost) — maximum gearing sets the limit

IV **Stress** 4
Stress: capex (assumed range) moves min DSCR the most — base 1.63x

V **Expansion option** 5
Phase 2 (20 MW): option value KRW 33.3bn at p = 30% — the right to wait adds KRW 3.1bn

VI **Korea vs U.S.** 6
Korea vs U.S.: different bottlenecks set debt capacity — grid and pre-leasing in Korea, scale and rates in the U.S.

VII **Development yield** 7
Development yield: in Korea one power-cost clause splits equity IRR: 16.1% (passed through) vs 5.7% (gross rent); in the U.S. the spread over debt is down to 2.1pp

VIII **Implications** 8
Implication: the first item in data-centre PF credit review is the power-cost structure — then grid approval and an anchor tenant

App. **Appendix** A1–A6
A1 Q&A · A2–A3 assumptions and sources by case · A4 Data notes · A5 Methodology · A6 Glossary

# Structure: committed leases with power billed separately; Korea adds a 3-yr ramp-up interest reserve — 20 MW + 20 MW option vs U.S. 100 MW

**Case A (main) 40 MW outer Seoul metro, KRW; Case B (comparison) 100 MW Virginia, USD — Seoul-metro grid approval 1.9% by count (10 of 522), 3.0% by capacity (1,010 of 33,592 MW)**

## The SPC repays debt from committed rent, power is billed to the tenant — an interest reserve covers the ramp-up gap *1,*2

Source: *1 KSJ Research *2 Data Center Scouts, Data center leasing (posted 25 Sep 2026, updated 8 Oct 2026); gr1d, Powered Shell vs Turnkey vs Colocation (15 Oct 2026)
Note: Case A structure (hypothetical). Power billed separately, 100% (wholesale leases quote rent per kW with power billed on top: Data Center Scouts, gr1d; both rents use one ex-power definition). CBRE's definition of whether rent includes power is not verified; in wholesale leasing, power is usually billed separately. Gross rent is a stress on p7. Interest reserve KRW 10.9bn = 3-yr ramp-up interest gap + 10% buffer, inside project cost

## Five contracts shape the cash flow — lenders watch leasing, rates, cost and grid *1

| Contract | Party | Key terms | Lender risk |
|---|---|---|---|
| Lease | Tenant | Long-term committed lease; rent per kW-month; annual escalation | Pre-lease ratio; tenant credit |
| Loan | Lenders | Target DSCR; max gearing; tenor; 3-yr ramp-up grace; DSRA; interest reserve | CFADS volatility; rates |
| EPC | Contractor | Fixed price; completion date; delay LDs | Equipment prices; delay |
| Power supply | Utility | Grid-connection approval; capacity | Phase 2 grid approval |
| Power cost | Tenant | Usage × tariff, 100% pass-through | Pass-through carve-outs |

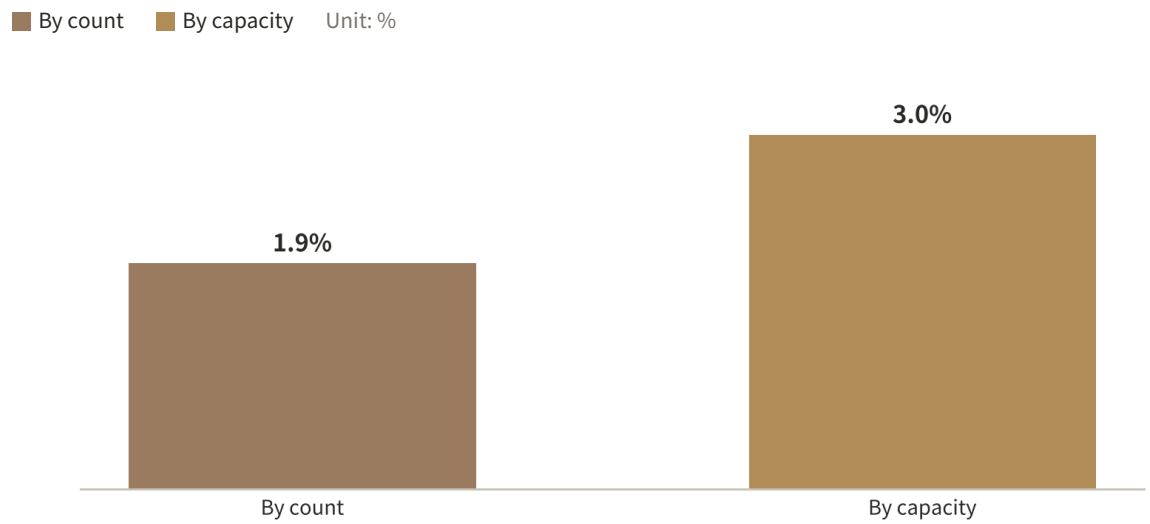

Source: *1 KSJ Research
Note: Hypothetical structure; actual terms vary by project

## Korea builds in 20 MW steps, the U.S. in one 100 MW block — same engine, different parameters *1,*2,*3,*4,*5

| | Case A (main) | Case B (comparison) |
|---|---|---|
| Location | Outer Seoul metro (Incheon, W. Gyeonggi) | Virginia, U.S. |
| Capacity (IT load) | 40 MW = 20 MW firm + 20 MW option | 100 MW, single phase |
| Currency · base rate | KRW · KTB 3y (3.84%) | USD · DGS10 (5.09%) |
| Rationale | Grid approval 1.9% count / 3.0% MW; grid impact assessment from 10 MW; domestic operating scale ~40 MW | Hyperscale scale; Virginia commercial sales growth (EIA) |

Source: *1 Blockmedia, readiness and breakeven conditions of four Korean AI data-centre projects (Seoul-metro phase-1 grid applications and final supply approvals, Aug 2024–Mar 2026) *2 Distributed Energy Act (grid impact assessment) *3 Bank of Korea ECOS market rates (daily), USD/KRW *4 FRED, Federal Reserve Bank of St. Louis (DGS10) *5 U.S. Energy Information Administration (EIA), Electricity retail sales
Note: Not real projects. Base rates: latest business day on or before 2026-10-20

## Seoul-metro grid approval is 1.9% count / 3.0% MW — why phase 2 is an option *1

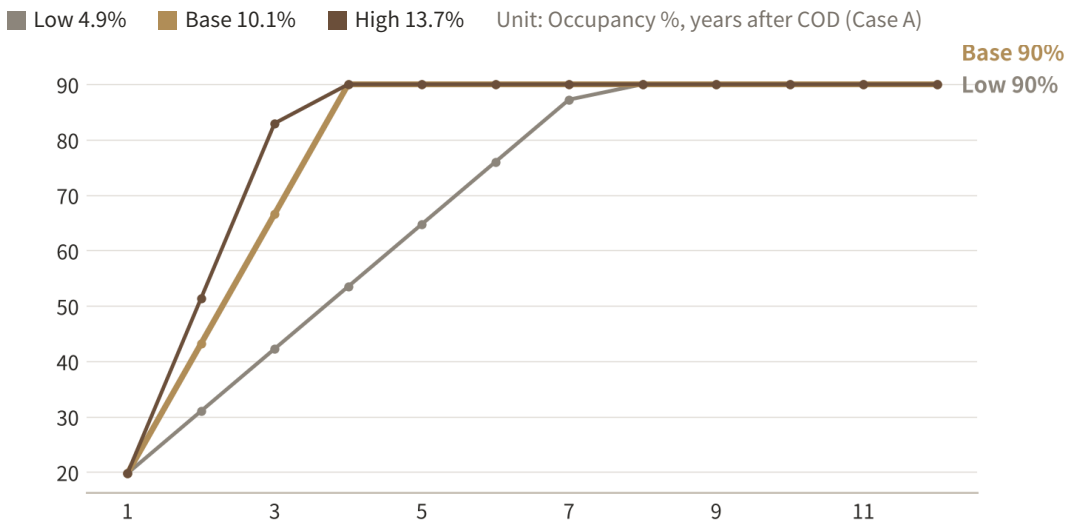

Source: *1 Blockmedia, readiness and breakeven conditions of four Korean AI data-centre projects (Seoul-metro phase-1 grid applications and final supply approvals, Aug 2024–Mar 2026)
Note: Seoul-metro grid approval 1.9% by count (10 of 522), 3.0% by capacity (1,010 of 33,592 MW). 2024.8~2026.3, all Seoul-metro phase-1 grid applications (final supply approval). Projects ≥10 MW need a grid impact assessment

© 2026 Shinjae Kang · KSJ Research · Research Note Vol.2 · 2026.10 · For education and research only, not investment advice · hypothetical cases

# Vol.1 data into PF inputs: base demand growth 10.1%, UST 10y 1.25pp above KTB 3y, peer margins point to pricing power

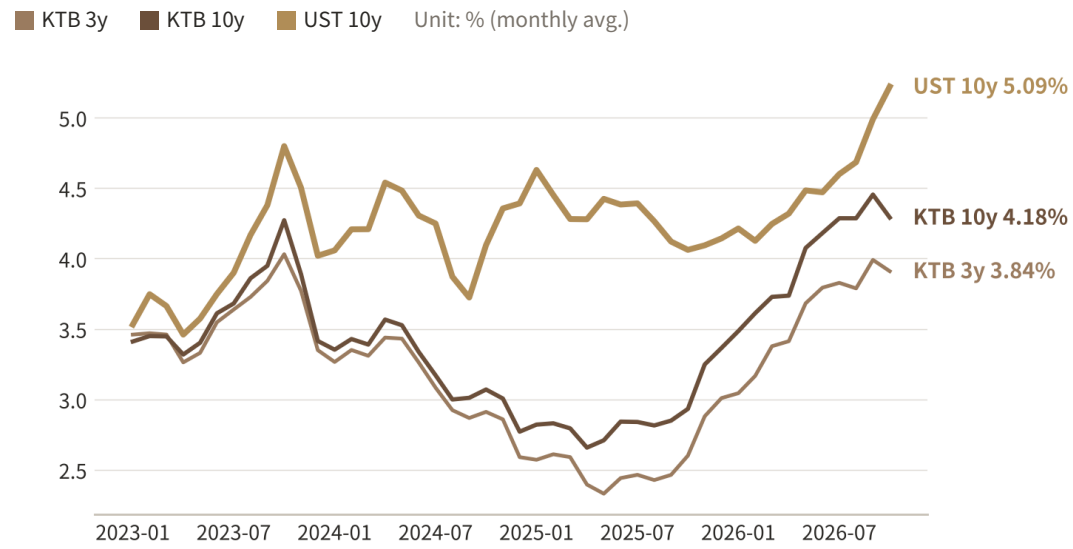

## Demand (IEA) → ramp-up · rates (ECOS, FRED) → base rates · peer margins (DART) → CAPEX stress · Virginia (EIA) → Case B demand and power

### Pre-lease 19.8% → stabilised 90%: ramp-up 3 yrs (base); IEA growth implies 6.2 (low) and 2.2 yrs (high) *1,*2

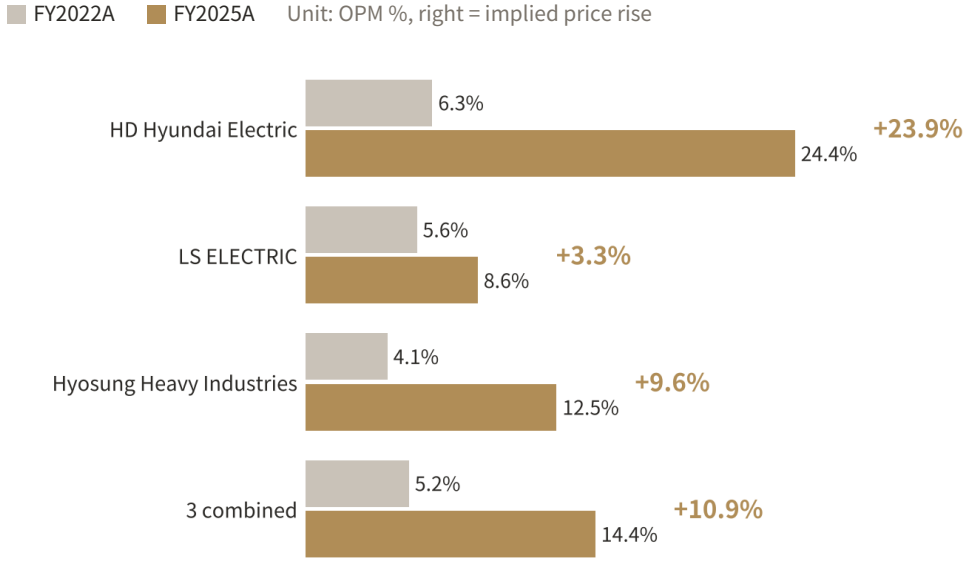

Source: *1 IEA, Energy and AI (Apr 2025), executive summary *2 Blockmedia (citing CBRE); CBRE Global Data Center Trends 2026; CBRE North America Data Center Trends H1 2026
Note: Growth = IEA data-centre power CAGR 2024→2035 (415→low 700, base 1,200, high 1,700 TWh). Scenario ramp-up = base 3 yrs (author's judgment) × base growth ÷ scenario growth

### Base rates (2026-10-20): KTB 3y 3.84%, 10y 4.18%; UST 10y 5.09% — model base-rate gap 1.25pp *1,*2

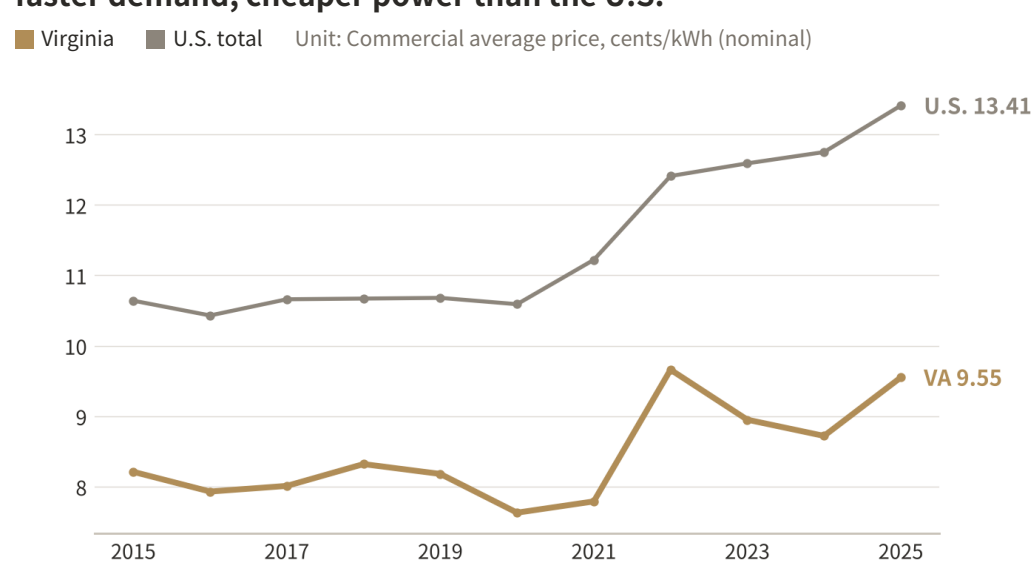

Source: *1 Bank of Korea ECOS market rates (daily), USD/KRW *2 FRED, Federal Reserve Bank of St. Louis (DGS10)
Note: Lines = monthly averages; end labels = as-of values. Model base rates: Korea = KTB 3y; U.S. = UST 10y (2026-10-16). Margins are separate

### Peer margins 5.2%→14.4% — if all price, equipment +10.9% (3.3–23.9%) *1

Source: *1 FSS DART annual reports (consolidated)
Note: Implied rise = (1 − start OPM) ÷ (1 − end OPM) − 1: an upper bound if unit costs were flat and all margin gain came from price. Volume, FX and mix are not separated — evidence for a stress, not causation

### Virginia: commercial sales 5.6%/yr (U.S. 0.9%); price 9.55¢/kWh (2025) — faster demand, cheaper power than the U.S. *1

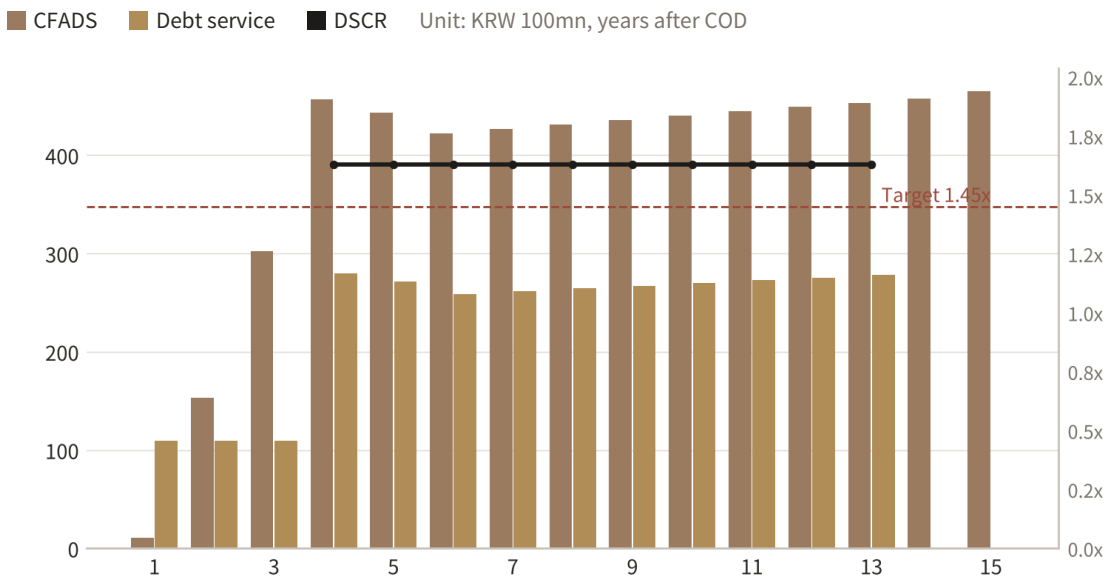

Source: *1 U.S. Energy Information Administration (EIA), Electricity retail sales
Note: Case B demand: Virginia commercial sales 2015→2025 5.6%/yr, +6.2% in 2025. Power price = Virginia 2025. Largest annual rise +24.0% in 2022 (sensitivity on p8)

© 2026 Shinjae Kang · KSJ Research · Research Note Vol.2 · 2026.10 · For education and research only, not investment advice · hypothetical cases

# Korea 40 MW debt capacity KRW 205bn (65% of cost) — maximum gearing sets the limit

## Min DSCR 1.63x · LLCR 1.59x · equity IRR 16.1% (ex-TV 14.0%) · interest reserve KRW 10.9bn

### Sculpting debt service at CFADS ÷ 1.45x gives KRW 230bn *1

Source: *1 KSJ Research
Note: CFADS = EBITDA − tax. Tenor = 2 yrs construction + after COD, 3 ramp-up years interest-only (gap from the interest reserve), then 10 yrs sculpted principal. Base scenario; straight-line depreciation 20 yrs; DSCR line = principal repayment years

### Debt KRW 205bn — maximum gearing sets the limit *1,*2

| Item | Value |
|---|---|
| Sculpting limit (target DSCR) | KRW 230bn |
| Gearing limit (65%) | KRW 205bn |
| Debt adopted (lower) | **KRW 205bn** |
| Binding constraint · effective DSCR | maximum gearing sets the limit · 1.63x |
| Cost = CAPEX + IDC + DSRA + interest reserve | KRW 315bn = KRW 290bn + KRW 8.9bn + KRW 5.5bn + KRW 10.9bn |
| Interest reserve = 3-yr interest gap 99 × (1 + 10%) | **KRW 10.9bn (drawn 99)** |
| Equity · gearing | KRW 110bn · 65.0% |
| Min · avg DSCR · LLCR | 1.63x · 1.63x · 1.59x |
| Project IRR · equity IRR · payback (from FC) | 12.1% · 16.1% · 10.6 yrs |
| Ex-TV project IRR · equity IRR (cap rate 7.0%) | 10.2% · 14.0% |
| Ramp-up min CFADS ÷ interest (before reserve) | 0.10x |

Source: *1 KSJ Research *2 Gridlines (2026); Lev (20 Aug 2026); Edaily (12 Oct 2026)
Note: Debt = min(sculpting, max gearing × total cost); cost includes IDC and initial DSRA and the interest reserve, solved iteratively. Min/avg DSCR over principal repayment years. Ramp-up uses a reserve, not capitalised interest (author's judgment; Gridlines 2026: ramp-up-dependent projects carry lower initial leverage and more equity). LLCR 1.59x < min DSCR 1.63x because LLCR includes the 3-yr ramp-up deficit (covered by the reserve)

### Waterfall: 3 ramp-up years interest-only, gap from the reserve → then principal → DSRA (6 months) → distributions *1

Unit: KRW 100mn

| Year | CFADS | Interest | Princ. | Reserve | DSRA net | Distrib. | DSCR |
|---|---|---|---|---|---|---|---|
| 1 | 10 | 109 | 0 | -99 | 0 | 0 | (0.10x) |
| 2 | 153 | 109 | 0 | – | 0 | 44 | (1.40x) |
| 3 | 302 | 109 | 0 | -10 | 85 | 117 | (2.76x) |
| 4 | 457 | 109 | 171 | – | -4 | 181 | 1.63x |
| 5 | 443 | 100 | 171 | – | -6 | 178 | 1.63x |
| 10 | 440 | 51 | 219 | – | 1 | 169 | 1.63x |
| 13 | 453 | 14 | 264 | – | -139 | 314 | 1.63x |

Source: *1 KSJ Research
Note: Reserve: negative = draw (interest gap); the balance is released to equity in the last grace year. Bracketed DSCR = ramp-up CFADS ÷ interest before reserve. DSRA target = next year's debt service × months/12, released at maturity. Negative principal = debt service below interest

### Debt barely moves across demand scenarios (KRW 207bn, gearing cap); min DSCR 1.46x–1.63x *1,*2

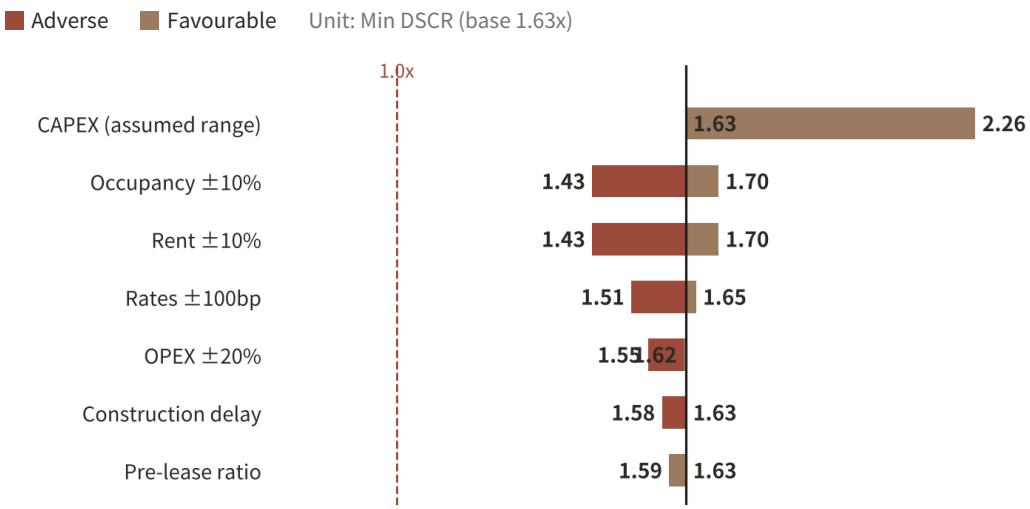

| Scenario (growth) | Debt | Min DSCR | LLCR | Project IRR | Equity IRR | Contr. DSCR |
|---|---|---|---|---|---|---|
| Low (ramp 6.2 yrs) | KRW 207bn | 1.46x | 1.35x | 11.2% | 14.3% | 0.02x |
| Base (ramp 3.0 yrs) | KRW 205bn | 1.63x | 1.59x | 12.1% | 16.1% | 0.02x |
| High (ramp 2.2 yrs) | KRW 205bn | 1.62x | 1.65x | 12.4% | 16.7% | 0.02x |

Source: *1 IEA, Energy and AI (Apr 2025), executive summary *2 KSJ Research
Note: Debt re-sized per scenario. Ramp-up = base period × IEA base growth ÷ scenario growth. Contracted DSCR = min DSCR over principal repayment years on 19.8% pre-leased rent only (year 13) — a gauge of the risk of having no anchor tenant

# Stress: capex (assumed range) moves min DSCR the most — base 1.63x

## Case A in full, Case B summarised · breakevens at min DSCR 1.0x and target · tornado · heatmap (rent × CAPEX)

### CAPEX (assumed range) moves min DSCR the most (1.63x–2.26x) *1,*2

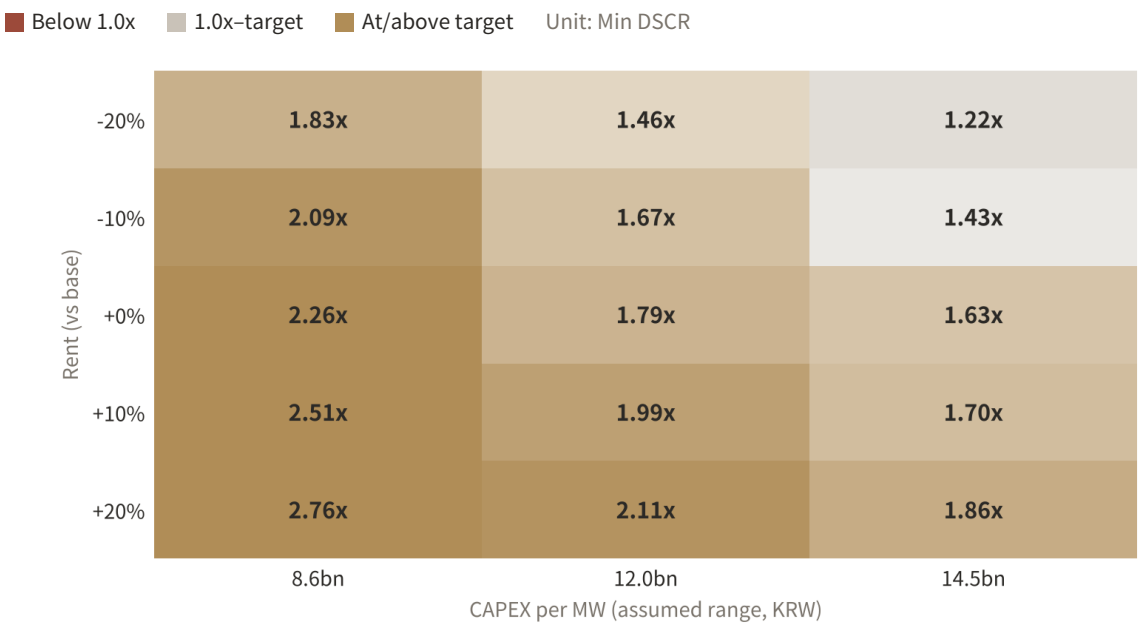

Source: *1 KSJ Research *2 FSS DART annual reports (consolidated)
Note: Debt schedule fixed at base. Delay = +4 quarters; pre-lease 16–23.5%; CAPEX = KRW 8.6–14.5bn per MW (mid 12.0bn); OPEX ±20% (unsourced judgment). Min DSCR covers principal repayment years: pre-lease only affects the 3-yr ramp-up (reserve period) (pre-lease 16.0%: reserve draw KRW 10.9bn of KRW 10.9bn, uncovered after DSRA KRW 0.0bn). Where the favourable side is below base (OPEX ±20%, Pre-lease ratio): higher profit uses up loss carryforwards sooner, raising tax in a sculpted year (disappears when re-run at a 0% tax rate) If rent turns gross (SPC pays power, debt fixed): min DSCR 0.64x, uncovered debt service KRW 84.6bn — p7.

### Breakevens where min DSCR falls below target (1.45x) and 1.0x *1

| Variable | Base | Target 1.45x | 1.0x |
|---|---|---|---|
| Rent (vs base) | 0% | -9% | -31% |
| Occupancy (vs base) | 0% | -9% | -31% |
| Pre-lease ratio | 19.8% | none in range | no effect on repayment years |
| CAPEX (vs base) | 0% | +13% | +66% |
| OPEX (vs base) | 0% | +43% | +152% |
| Base-rate change | 0bp | +157bp | +771bp |
| Construction delay | 0 qtrs | +15 qtrs | none in range |

Source: *1 KSJ Research
Note: One variable at a time; debt schedule fixed (extra CAPEX and delay interest funded at base gearing); nearest crossing to base. 'Base = target': sculpting already sets base min DSCR at target. 'None in range': no crossing in the search range

### Rent -20% with CAPEX KRW 14.5bn/MW: min DSCR 1.22x *1

Source: *1 KSJ Research
Note: Extra CAPEX funded at base gearing (debt and principal scaled)

### Case B: min DSCR 1.30x; most sensitive: Rent −20% — 0.98x if contract rents sit 20% below CBRE quotes *1

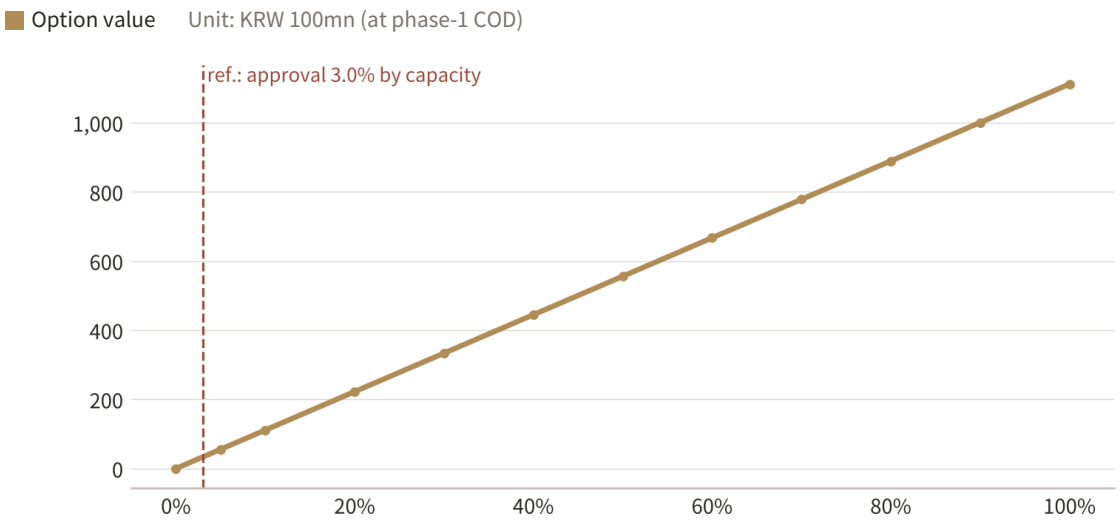

| Variable | Adverse | Favourable |
|---|---|---|
| Rent −20% | 0.98x | 1.30x |
| Rent ±10% | 1.14x | 1.38x |
| Occupancy ±10% | 1.14x | 1.32x |
| Rates ±100bp | 1.17x | 1.32x |
| CAPEX (equipment prices) | 1.24x | 1.30x |
| Construction delay | 1.24x | 1.30x |
| OPEX ±20% | 1.24x | 1.30x |

Source: *1 KSJ Research
Note: Same stresses plus rent −20%: the risk that hyperscale contract rents sit below CBRE quotes (250–500 kW). CAPEX (equipment prices) = power-equipment share 21% (C&W 2026) × peer-implied price rise (high) = +5.0%. Debt schedule fixed; 250bp margin scenario (not yet sourced)

# Phase 2 (20 MW): option value KRW 33.3bn at p = 30% — the right to wait adds KRW 3.1bn

## Approval 10/30/50% · decision at COD+3 yrs · ref.: Seoul-metro approval 1.9% count / 3.0% MW

### Option value at approval probability 10%/30%/50%: KRW 11.1bn / KRW 33.3bn / KRW 55.6bn *1,*2

Source: *1 KSJ Research *2 Blockmedia, readiness and breakeven conditions of four Korean AI data-centre projects (Seoul-metro phase-1 grid applications and final supply approvals, Aug 2024–Mar 2026)
Note: Approval scenarios 10/30/50% (base 30%, author's judgment). The approval rate covers all Seoul-metro phase-1 applications (Blockmedia), not one project's odds. Value = p × conditional value.

### Build now KRW 30.2bn vs wait KRW 33.3bn — value of waiting KRW 3.1bn *1

| Item (p = 30%) | Value |
|---|---|
| Build now (on approval) | KRW 30.2bn |
| Wait (optimal timing, option value) | **KRW 33.3bn** |
| Flexibility = option − max(now, 0) | **KRW 3.1bn** |
| Trigger rent (Low) | KRW 355,636/kW-mo |
| Trigger rent (Base) | KRW 254,524/kW-mo |
| Trigger rent (High) | KRW 254,524/kW-mo |
| NPV-zero rent (base) | KRW 185,024/kW-mo |
| Share of paths built · mean build year | 83% · 3.9 yrs |

Source: *1 KSJ Research
Note: Decision year 3 after phase-1 COD (= end of ramp-up, when demand is confirmed); window 2 yrs; discount 10%; rent vol. 15% (judgment); 20,000 paths, seed 42: s.e. 0.6% (1,000 paths: 2.7%) — converged. Trigger rent for high = base: by the decision date (COD+3) phase 1 is stabilised at 90% in both (ramp-up 3.0/2.2 yrs), so phase-2 pre-lease and NPV are identical (not a grid-resolution effect).

### Option value KRW 14.9–64.2bn across discount rates and windows — waiting adds flexibility *1

Unit: KRW bn; brackets = flexibility (p = 30%)

| Discount \ window | 0 yrs | 2 yrs | 4 yrs |
|---|---|---|---|
| 8% | 62.5 (0.3) | 63.3 (1.6) | 64.2 (2.3) |
| 10% | 32.2 (1.3) | **33.9 (3.2)** | 35.1 (4.3) |
| 12% | 14.9 (3.5) | 17.1 (5.9) | 18.2 (7.0) |

Source: *1 KSJ Research
Note: Gold = headline cell at the author's 10% discount rate and 2-yr window; other cells are sensitivity axes. 8,000 paths per cell

### Decision structure: grid approval (p) → observe rent and demand → build now or wait *1

**Phase 2 (20 MW) = the right to wait for grid approval and demand**

- Uncertainty ①: grid approval with probability p at the decision date; zero value if refused
- Uncertainty ②: rent follows geometric Brownian motion (drift = escalation, volatility σ)
- Uncertainty ③: IEA low/base/high ramp-up drawn per path — observed via phase 1 occupancy
- Phase 2 pre-lease = phase 1 occupancy in the decision year (build after demand is confirmed)
- Valuation: Monte Carlo + LSM (least-squares continuation value), fixed seed, convergence by path count

Source: *1 KSJ Research
Note: Unlevered NPV. Option value = p × value given approval

# Korea vs U.S.: different bottlenecks set debt capacity — grid and pre-leasing in Korea, scale and rates in the U.S.

**Base-rate gap +1.25pp (UST 10y − KTB 3y) · grid approval 1.9% count / 3.0% MW · pre-leasing 16–23.5% · FX 1,332.1**

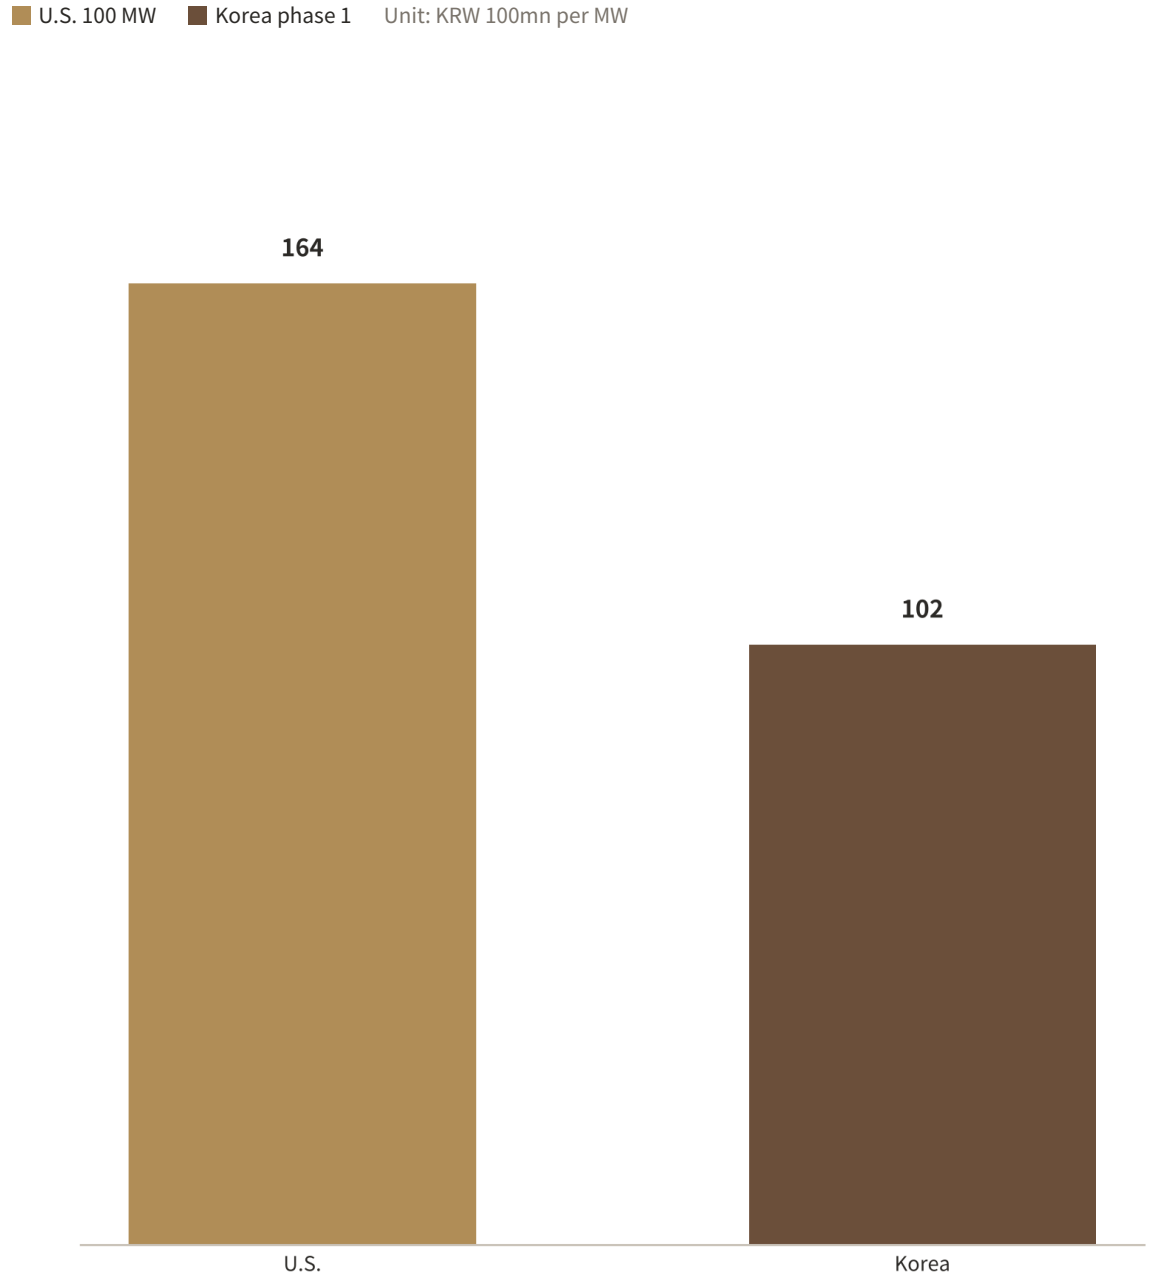

## Debt, DSCR and equity IRR side by side — same engine, different bottlenecks

*1,*2,*3,*4,*5,*6,*7

| | Korea 40 MW (Case A) | U.S. 100 MW (Case B) |
|---|---|---|
| Capacity · phasing | 40 MW (20 firm + 20 option) | 100 MW single |
| Currency · base rate | KRW · KTB 3y 3.84% | USD · UST 10y 5.09% |

| Key bottleneck | **Grid (approval 1.9% count / 3.0% MW) · pre-leasing (16–23.5%)** | **Scale (100 MW, 5x Korea phase 1) · rates (+1.25pp)** |

Source: *1 Bank of Korea ECOS market rates (daily), USD/KRW *2 FRED, Federal Reserve Bank of St. Louis (DGS10) *3 Blockmedia, readiness and breakeven conditions of four Korean AI data-centre projects (Seoul-metro phase-1 grid applications and final supply approvals, Aug 2024–Mar 2026) *4 Blockmedia (citing CBRE); CBRE Global Data Center Trends 2026; CBRE North America Data Center Trends H1 2026 *5 Etoday (citing Daol Investment & Securities, 1 Oct 2026); Edaily (12 Oct 2026); Cushman & Wakefield 2026 Data Center Development Cost Guide *6 Gridlines (2026); Lev (20 Aug 2026); Edaily (12 Oct 2026) *7 KSJ Research
Note: KRW = USD mn × ECOS USD/KRW 1,332.1 (2026-10-20) ÷ 100. Korea debt is for phase 1 (20 MW). Case B brackets = 150–350bp margin range (margin not yet sourced). Straight-line depreciation 20 yrs; terminal value = year-26 EBITDA ÷ cap rate (A 7.0%, judgment: no Korean deal evidence, set 1pp above the U.S.; B 6.0%: Houlihan Lokey stabilised hyperscale 5.0–7.5% (5.0–7.25% in the same document's 1H 2026 table), conservative vs low-5% Northern Virginia deals)

## Debt per MW: U.S. KRW 16.4bn vs Korea KRW 10.2bn *1,*2

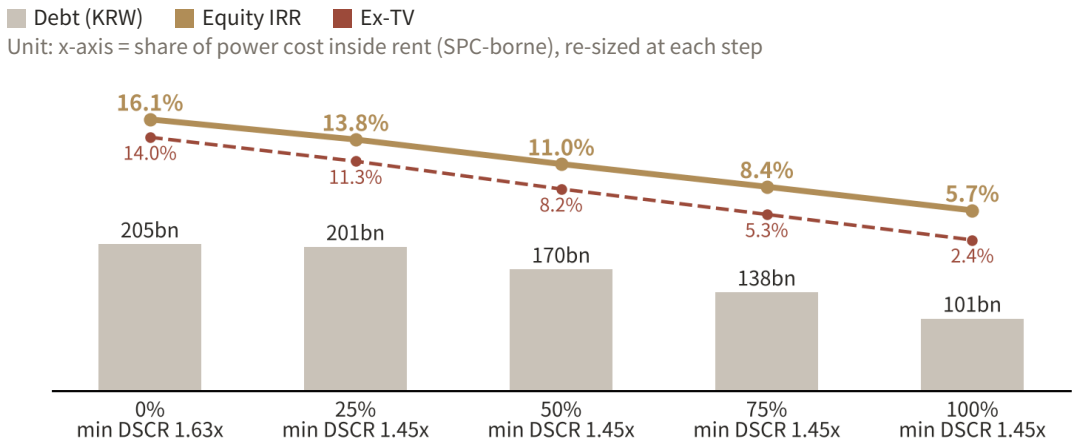

Source: *1 Bank of Korea ECOS market rates (daily), USD/KRW *2 KSJ Research
Note: USD debt converted at the as-of rate (no hedging cost). CAPEX per MW (KRW 14.5bn vs USD 18.2mn) explains most of the gap

# Development yield: in Korea one power-cost clause splits equity IRR: 16.1% (passed through) vs 5.7% (gross rent); in the U.S. the spread over debt is down to 2.1pp

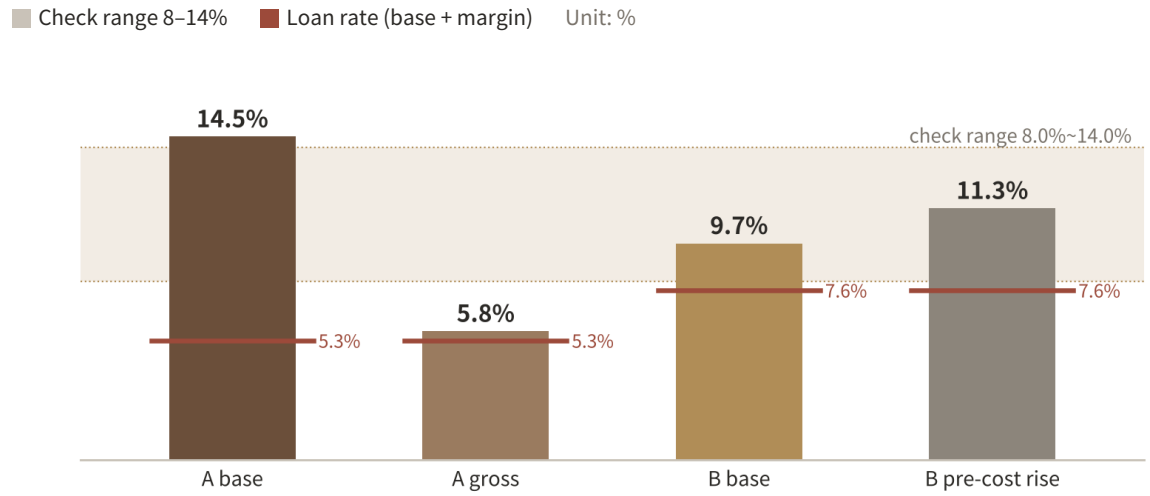

## Debt, equity IRR and min DSCR by power share in rent (0–100%) · yield-on-cost check (8–14%) · Case B contracted sizing · build cost vs rent

### Power share in rent 0%→100%: equity IRR 16.1% → 5.7%; debt KRW 205bn → KRW 101bn *1,*2,*3,*4

Source: *1 Blockmedia (citing CBRE); CBRE Global Data Center Trends 2026; CBRE North America Data Center Trends H1 2026 *2 Data Center Scouts, Data center leasing (posted 25 Sep 2026, updated 8 Oct 2026); gr1d, Powered Shell vs Turnkey vs Colocation (15 Oct 2026) *3 Sidae Ilbo (27 Aug 2026; KEPCO 2025 average industrial tariff) *4 KSJ Research
Note: 0% = power billed separately (base: wholesale leases quote rent per kW with power on top, Data Center Scouts, gr1d — CBRE's definition of whether rent includes power is not verified; in wholesale leasing, power is usually billed separately); 100% = gross rent (SPC pays; stress). Power = IT 20 MW × occupancy × IT load 70% × PUE 1.3 × 8,760 h × KRW 181.9/kWh (KEPCO 2025 avg industrial), +2%/yr — KRW 27.7bn in the first stabilised year. With gross rent, a KRW -10/kWh cut (proposal for the northern Seoul metro, Sidae Ilbo 2026-08-27) gives equity IRR 6.3%, debt KRW 110bn — proposal only, sensitivity

### Yield on cost: A base 14.5%; A gross 5.8%; B base 9.7%; B pre-cost rise 11.3% — outside 8–14% (±1pp): A gross *1,*2,*3,*4

Source: *1 Etoday (citing Daol Investment & Securities, 1 Oct 2026); Edaily (12 Oct 2026); Cushman & Wakefield 2026 Data Center Development Cost Guide *2 Bank of Korea ECOS market rates (daily), USD/KRW *3 FRED, Federal Reserve Bank of St. Louis (DGS10) *4 KSJ Research
Note: Yield on cost = first stabilised-year EBITDA ÷ total cost (CAPEX + IDC + DSRA + reserve). Loan rate = KTB 3y 3.84% + 150bp; UST 10y 5.09% + 250bp (scenario). 8–14% (±1pp) is the check range

### Sizing on contracted revenue at 1.30x gives USD 1,047mn (-15%) vs USD 1,232mn on total revenue *1,*2,*3

| Case B (100 MW) | Total-revenue sizing (base) | Contracted sizing (80% pre-let) |
|---|---|---|
| Debt (share of cost) | USD 1,232mn (63%) | **USD 1,047mn (54%)** |
| KRW equivalent | KRW 1,641bn | KRW 1,394bn |
| Min DSCR (total revenue) | 1.30x | 1.30x |
| Min DSCR (contracted only) | 1.06x | 1.30x |
| Avg DSCR · LLCR | 1.30x · 1.30x | 1.52x · 1.51x |
| Equity IRR | 13.6% | 13.0% |

Source: *1 Blockmedia (citing CBRE); CBRE Global Data Center Trends 2026; CBRE North America Data Center Trends H1 2026 *2 Gridlines (2026); Lev (20 Aug 2026); Edaily (12 Oct 2026) *3 KSJ Research
Note: Contracted sizing sculpts debt service at CFADS ÷ 1.30x using 80% pre-let rent over the 15-yr lease, net of full OPEX. 250bp margin scenario. A floor if lenders ignore unlet capacity

### U.S.: yield on cost 9.7% − loan rate 7.59% = 2.1pp (3.7pp before the cost rise) *1,*2,*3,*4,*5

**Cost outran rent: AI-spec build cost +21% in a year (Cushman & Wakefield 2026) vs rent escalation of 3%/yr**

- Yield on cost 11.3% → 9.7% (-1.6pp) vs a re-run at pre-rise cost and last year's rent
- Spread over the 7.59% loan rate (UST 10y 5.09% + 250bp): 3.7pp → 2.1pp — development yield pressed towards the cost of debt
- Project IRR 12.6% → 11.4%; equity IRR 16.5% → 13.6%; debt USD 1,174mn → USD 1,232mn
- Link to Vol.1: equipment makers' profit is the developer's cost — peer margins 5.2%→14.4% (FY2022A→FY2025A, DART) sit on the cost side (a link, not a causal claim)

Source: *1 Etoday (citing Daol Investment & Securities, 1 Oct 2026); Edaily (12 Oct 2026); Cushman & Wakefield 2026 Data Center Development Cost Guide *2 Blockmedia (citing CBRE); CBRE Global Data Center Trends 2026; CBRE North America Data Center Trends H1 2026 *3 FRED, Federal Reserve Bank of St. Louis (DGS10) *4 FSS DART annual reports (consolidated) *5 KSJ Research
Note: Pre-rise = CAPEX per MW ÷ (1 + 21%), rent ÷ (1 + 3%), same OPEX ratio. 21% per reporting on the C&W 2026 Data Center Development Cost Guide

# Implication: the first item in data-centre PF credit review is the power-cost structure — then grid approval and an anchor tenant

## Lender checklist · limitations · next: Vol.3 (IPO pricing, overseas peers) · Case B power-cost sensitivity (Virginia prices)

### Lender checklist: check the power-cost structure first; then Korea — approval and tenants, U.S. — rates and cost *1,*2,*3,*4,*5,*6

| Item | Korea 40 MW | U.S. 100 MW | Pages |
|---|---|---|---|
| ① Power-cost clause | **Pass-through vs gross: equity IRR 16.1% vs 5.7%; debt KRW 205bn vs KRW 101bn — check: take-or-pay minimum on billed power (trending to 60–85% of allocated power)** | Pass-through and take-or-pay clauses; tenant burden as Virginia prices rise (table below right) | 7, 8, A1 |
| Grid approval | Phase 1 approval a must; phase 2 as an option (1.9% count / 3.0% MW) | Confirm connection timing | 1, 5 |
| Pre-leasing | Market 16–23.5% | Pre-lease 80%; 15-yr lease | 3, 4 |
| Rates | KTB 3y 3.84% + 150bp | UST 10y 5.09% + margin TBC | 2, 6 |
| Construction cost | KRW 8.6–14.5bn per MW (mid 12.0bn) | Large absolute exposure | 2, 4 |
| OPEX | Unsourced judgment → ±20% stress | Unsourced judgment → ±20% stress | 4 |
| Ramp-up | Interest reserve KRW 10.9bn (in cost); 3-yr interest-only | Contracted sizing USD 1,047mn vs total USD 1,232mn | 3, 7 |

Source: *1 Data Center Scouts, Data center leasing (posted 25 Sep 2026, updated 8 Oct 2026); gr1d, Powered Shell vs Turnkey vs Colocation (15 Oct 2026) *2 Blockmedia, readiness and breakeven conditions of four Korean AI data-centre projects (Seoul-metro phase-1 grid applications and final supply approvals, Aug 2024–Mar 2026) *3 Blockmedia (citing CBRE); CBRE Global Data Center Trends 2026; CBRE North America Data Center Trends H1 2026 *4 Etoday (citing Daol Investment & Securities, 1 Oct 2026); Edaily (12 Oct 2026); Cushman & Wakefield 2026 Data Center Development Cost Guide *5 Gridlines (2026); Lev (20 Aug 2026); Edaily (12 Oct 2026) *6 KSJ Research

Note: Checklist for the hypothetical cases; figures from the body

### Limitations of this note

- Both cases are hypothetical; author's judgments are flagged as such in A2–A3
- Depreciation (20 yrs), PUE 1.3, IT load 70% and cap rates are unsourced judgments — IRRs depend on cap rates: ex-TV equity IRR Korea 16.1% → 14.0%, U.S. 13.6% → 10.3%
- Case A's KRW 250k rent is treated as ex-power (billed separately), the same definition as the U.S. CBRE figures — CBRE's definition of whether rent includes power is not verified; in wholesale leasing, power is usually billed separately. Gross rent is the p7 stress
- Peer margin → price is an upper bound, not causal (volume, FX, mix not separated)

Note: Updated as sources are confirmed

### Next in Vol.3: IPO pricing and overseas peers

**A hypothetical unlisted power-equipment IPO in a re-rated sector: what price range?**

- Korean peers' P/E and EV/EBITDA + overseas peers (SEC EDGAR)
- Market cap (listed parent) vs financials (filer) checked for all five
- Fair value → IPO discount → indicative price range · Monte Carlo sensitivity

Note: Timing and method of Vol.3 may change

### At Virginia's 9.55¢, power costs 31–48% of rent — pass-through shields the SPC, not the tenant *1,*2

Unit: USD per IT kW-month (brackets = share of USD 190 rent)

| PUE | Price 2025 | Price 2025 +24.0% |
|---|---|---|
| 1.2 | $59 (31%) | $73 (38%) |
| 1.3 | $63 (33%) | $79 (41%) |
| 1.4 | $68 (36%) | $85 (45%) |
| 1.5 | $73 (39%) | $91 (48%) |

Source: *1 U.S. Energy Information Administration (EIA), Electricity retail sales *2 Blockmedia (citing CBRE); CBRE Global Data Center Trends 2026; CBRE North America Data Center Trends H1 2026
Note: Power = 730 h × IT load 70% × PUE × price. Price = EIA Virginia commercial 2025; right column applies the largest annual rise (2022). Shaded = base PUE 1.3 (judgment); other rows are sensitivities

# Expected Q&A: what lenders ask first

## Questions likely in credit review and lender due diligence, with page references

### 10 expected questions, including the lender's view [*1,*2,*3,*4,*5,*6,*7,*8]

| Question | Answer | Page |
|---|---|---|
| Can it borrow without an anchor tenant? | Contracted rent (19.8% pre-let) does not even cover OPEX and power (min DSCR 0.02x). Ramp-up interest is pre-funded in a reserve and debt is sculpted on stabilised CFADS. At 16.0% pre-lease the KRW 10.9bn reserve is used up and the DSRA covers the rest. Without an anchor tenant, equity carries the ramp-up risk | 2, 3, 4 |
| Why 40 MW in Korea? | Seoul-metro grid approval 1.9% by count (10 of 522), 3.0% by capacity (1,010 of 33,592 MW). Projects of 10 MW or more need a grid impact assessment, and domestic operating sites are around 40 MW. Hence 20 MW firm plus a 20 MW option built after approval and demand are confirmed | 1, 5 |
| Why 100 MW in the U.S., and what differs? | Virginia commercial sales grow 5.6%/yr vs U.S. 0.9%. But its base rate (UST 10y) is 1.25pp above KTB 3y, so debt service is heavier at the same DSCR | 2, 6 |
| What if rates rise 100bp? | With the schedule fixed, min DSCR 1.63x → 1.51x; equity IRR 16.1% → 15.5% | 4 |
| What if equipment prices rise? | If the three peers' margin rise 5.2%→14.4% (FY2022A→FY2025A) were all price, equipment prices rose 3.3%–23.9% (upper bound, not causal). | 2, 4 |
| Who pays for power? | In both cases the tenant pays usage × tariff (billed separately: wholesale rent is quoted per kW with power on top — Data Center Scouts, gr1d; one definition for both rents). If rent included power, the SPC would bear KRW 27.7bn in the first stabilised year: equity IRR 16.1% → 5.7%, debt KRW 205bn → KRW 101bn. That makes it the first clause a lender checks | 1, 7 |
| If the tenant pays for power, is the SPC's power risk gone? | No. It depends on take-or-pay minimums and how unused power is treated. If the tenant draws less than its allocation, charges based on contracted capacity can stay with the SPC, so check whether the lease sets a minimum (trending to 60–85% of allocated power, Data Center Scouts). With one, the risk becomes tenant credit risk. The base assumes full pass-through; at half, equity IRR falls 16.1% → 11.0% (p7 curve) | 7, 8 |
| How is interest paid during ramp-up? | For 3 ramp-up years after COD only interest is paid. The gap where CFADS falls short of interest (base-case total KRW 9.9bn) plus 10% — KRW 10.9bn — is funded at financial close inside project cost as an interest reserve. Interest is never capitalised, so the balance does not grow; principal is sculpted to CFADS from year 4 | 1, 3 |
| Build phase 2 now or wait? | At p = 30%: build now KRW 30.2bn vs wait KRW 33.3bn; the right to wait is worth KRW 3.1bn | 5 |
| How is FX handled for the U.S. case? | Computed in USD, converted at ECOS USD/KRW 1,332.1 (2026-10-20): KRW 100mn = USD mn × FX ÷ 100. Hedging costs are excluded | 6, A4 |

| USD/KRW | 1,332.1 | 2026-10-20 | ECOS |
| Demand growth (low·base·high) | 4.87% · 10.13% · 13.68% | 2024→2035 | IEA |
| 3-peer combined OPM | 5.16% → 14.44% | FY2022A→FY2025A | DART |
| Grid approval (count) | 10 ÷ 522 = 1.92% | 2024.8~2026.3 | Blockmedia (verified) |
| Grid approval (capacity) | 1,010 ÷ 33,592 = 3.01% | 2024.8~2026.3 | Blockmedia (verified) |
| Virginia commercial average price | 9.55¢/kWh | 2025 | EIA |
| KEPCO average industrial tariff (Case A) | KRW 181.9/kWh | 2025 | Sidae Ilbo 2026-08-27 |

Note: Latest business day on or before 2026-10-20. KRW = USD mn × USD/KRW ÷ 100

# Methodology: one engine, case parameters, verified calculations

## Every figure is calculated from data and assumptions, and conclusions are generated from the results

**Data links → PF model → stress and option → checks and report** [*1]

### 1. Data links

IEA → ramp-up

ECOS · FRED → base rates

DART → CAPEX stress

EIA → Case B

### 2. PF model

Quarterly build, IDC

CFADS → sculpting

Gearing cap

Waterfall · DSRA

### 3. Stress, option

Breakevens, tornado

Heatmap

LSM Monte Carlo

Fixed seed, convergence

### 4. Checks, report

Accounting identities

DSCR, IRR, FX checks

Conclusion titles

Korean & English

Built with an AI coding tool (Claude Code) for data links, the PF model, Monte Carlo and report generation; case design, assumption sourcing and number checks by the author.

# Glossary: the lender's vocabulary

**Units: KRW 100mn, USD mn · %, x**

## Glossary

| Term | Definition |
|---|---|
| CFADS | Cash flow available for debt service = EBITDA − tax |
| DSCR | Debt service cover ratio = CFADS ÷ (interest + principal) |
| LLCR | Loan life cover ratio = PV of CFADS over loan life ÷ debt |
| Sculpting | Sizing debt by setting each year's debt service = CFADS ÷ target DSCR |
| Maximum gearing | Cap on debt ÷ total project cost (LTC) |
| DSRA | Debt service reserve account: months of next year's debt service |
| IDC | Interest during construction, capitalised into project cost |
| Grace period | Principal holiday (interest paid or capitalised) |
| Interest reserve | Account funded at close from project cost to pay ramp-up interest that CFADS cannot cover |
| Yield on cost | First stabilised-year EBITDA ÷ total cost; development yield compared with debt cost and cap rates |
| Committed lease | Long-term lease paying for contracted capacity regardless of use |
| Pass-through | Clause passing power cost to the tenant at usage × tariff |
| MW (IT) | Capacity for IT equipment; total facility = IT × PUE |
| PUE | Total facility power ÷ IT power |
| Project IRR / Equity IRR | IRR of unlevered after-tax cash flow / of equity cash flow |
| Real option | Value of the right to defer an investment |
| LSM | Least-squares Monte Carlo: regression estimates continuation value to time exercise |
| Grid impact assessment | Pre-assessment of grid impact for large loads (10 MW+) |

Note: Shaded = core lender metrics
